5 Original AI Prompts

A practical prompt collection across text, image generation, video, coding, and education

Purpose	These original prompts demonstrate how to give an AI tool a role, a clear task, useful context, specific requirements, and a defined output.

1. ChatGPT — Text-Based Prompt

Goal: Create a practical, engaging piece of written content.

> Act as a friendly productivity coach. Write a 7-day screen-time improvement plan for a college student who spends too much time on social media and wants to study more consistently. Include one realistic goal for each day, a simple daily schedule, two strategies for handling distractions, and a short reflection question at the end of each day. Use clear, encouraging language, organize the plan with headings and a table, and avoid judgmental wording. Finish with three measurable signs of progress.

2. DALL·E — Image-Based Prompt

Goal: Generate a clear, visually appealing awareness poster.

> Create a polished vertical school poster titled “MAKE TIME FOR WHAT MATTERS” about healthy digital habits. Show a student putting a smartphone aside and choosing between studying, outdoor activity, and spending time with friends. Use a bright blue and teal palette, friendly editorial illustration, expressive characters, simple icons, strong visual hierarchy, and plenty of clean space. Include the exact supporting text: “Pause the scroll. Enjoy the moment.” and “Set limits • Take breaks • Stay connected.” Make all text large, correctly spelled, and easy to read; do not add logos, watermarks, or extra text.

3. SORA — Video-Based Prompt

Goal: Plan a short cinematic video with a clear story.

> Create a 20-second, 16:9 inspirational short film about a college student reclaiming time from a phone. Opening, 0–5 seconds: close-up of a student endlessly scrolling in a dim room, with the clock advancing. Middle, 5–14 seconds: the student activates a focus timer, places the phone face down, and begins studying; use a smooth transition to warm daylight. Ending, 14–20 seconds: the student finishes a task, smiles, and joins friends outdoors. Use natural lighting, realistic movement, gentle camera motion, consistent character appearance, and an uplifting instrumental mood. End on a clean title card reading “YOUR TIME, YOUR CHOICE.” No voice-over, no extra captions, and no visible brand logos.

4. Coding or Logic — Python Prompt

Goal: Ask for a working program and an explanation of its logic.

> Act as a patient Python tutor. Write a beginner-friendly command-line program that tracks daily screen time for up to five apps. Let the user enter each app name and minutes used, validate that minutes are non-negative integers, and calculate the total time, the app used most, and whether the total exceeds a user-defined daily limit. Display a neat summary and a practical suggestion if the limit is exceeded. Use functions, meaningful variable names, and input validation; do not use external libraries. Then explain the algorithm step by step, provide sample input/output, and include three test cases, including invalid input.

5. Education or Training — Lesson Prompt

Goal: Create a short interactive learning session.

> Design a 30-minute introductory lesson for first-year college students on “How to Write Better AI Prompts.” Assume learners are beginners. State three learning objectives, explain the difference between a vague prompt and a specific prompt, and demonstrate the improvement using two before-and-after examples. Include a 5-minute pair activity, a short quiz with five questions and an answer key, and an exit ticket students can complete in two minutes. Use plain language, an inclusive tone, and a minute-by-minute lesson plan. Finish with a simple rubric for assessing whether a prompt is clear, contextual, and specific.

Tip: For best results, review the generated output and refine the prompt with additional constraints or examples.
